Neural Networks: Learning

Cost function

Binary classification

$$y = 0$$
 or 1

1 output unit

Neural Network (Classification)
$$\{(x^{(1)},y^{(1)}),(x^{(2)},y^{(2)}),\dots,(x^{(m)},y^{(m)})\}$$

 $L=\ \ ext{total no. of layers in network}$

 $s_l = 1$ no. of units (not counting bias unit) in laver l

Multi-class classification (K classes)

$$y \in \mathbb{R}^K$$
 E.g. $\left[\begin{smallmatrix} 1 \\ 0 \\ 0 \\ 0 \end{smallmatrix} \right]$, $\left[\begin{smallmatrix} 0 \\ 1 \\ 0 \\ 0 \end{smallmatrix} \right]$, $\left[\begin{smallmatrix} 0 \\ 0 \\ 1 \\ 0 \end{smallmatrix} \right]$, $\left[\begin{smallmatrix} 0 \\ 0 \\ 1 \\ 0 \end{smallmatrix} \right]$ pedestrian car motorcycle truck

K output units

Cost function

Logistic regression:

$$J(\theta) = -\frac{1}{m} \left[\sum_{i=1}^{m} y^{(i)} \log h_{\theta}(x^{(i)}) + (1 - y^{(i)}) \log(1 - h_{\theta}(x^{(i)})) \right] + \frac{\lambda}{2m} \sum_{i=1}^{n} \theta_{j}^{2}$$

Neural network:

$$h_{\Theta}(x) \in \mathbb{R}^{K} \quad (h_{\Theta}(x))_{i} = i^{th} \text{ output}$$

$$J(\Theta) = -\frac{1}{m} \left[\sum_{i=1}^{m} \sum_{k=1}^{K} y_{k}^{(i)} \log(h_{\Theta}(x^{(i)}))_{k} + (1 - y_{k}^{(i)}) \log(1 - (h_{\Theta}(x^{(i)}))_{k}) \right]$$

$$+ \frac{\lambda}{2m} \sum_{l=1}^{L-1} \sum_{i=1}^{s_{l}} \sum_{j=1}^{s_{l+1}} (\Theta_{ji}^{(l)})^{2}$$

Machine Learning

Neural Networks: Learning

Backpropagation algorithm

Gradient computation

$$J(\Theta) = -\frac{1}{m} \left[\sum_{i=1}^{m} \sum_{k=1}^{K} y_k^{(i)} \log h_{\theta}(x^{(i)})_k + (1 - y_k^{(i)}) \log(1 - h_{\theta}(x^{(i)})_k) \right] + \frac{\lambda}{2m} \sum_{l=1}^{L-1} \sum_{i=1}^{s_l} \sum_{j=1}^{s_{l+1}} (\Theta_j^{(l)})^2$$

$$\rightarrow \min_{\Theta} J(\Theta)$$

Need code to compute:

$$\Rightarrow \frac{J(\Theta)}{\partial \Theta_{i,i}^{(l)}} J(\Theta) \iff$$

Gradient computation

Given one training example (x, y): Forward propagation:

$$\underline{a^{(1)}} = \underline{x}$$

$$\Rightarrow z^{(2)} = \Theta^{(1)}a^{(1)}$$

$$\Rightarrow a^{(2)} = g(z^{(2)}) \text{ (add } a_0^{(2)})$$

$$\Rightarrow z^{(3)} = \Theta^{(2)}a^{(2)}$$

$$\Rightarrow a^{(3)} = g(z^{(3)}) \text{ (add } a_0^{(3)})$$

$$\Rightarrow z^{(4)} = \Theta^{(3)}a^{(3)}$$

$$\Rightarrow a^{(4)} = h_{\Theta}(x) = g(z^{(4)})$$

Gradient computation: Backpropagation algorithm

Intuition: $\delta_j^{(l)} =$ "error" of node j in layer l.

For each output unit (layer L = 4)
$$\delta_j^{(4)} = a_j^{(4)} - y_j \qquad (ho(x))_j \quad \delta^{(4)} = a_j^{(4)} - y_j$$

$$(\Theta^{(3)})^T \delta^{(4)} \cdot * g'(z^{(3)})$$

$$\delta^{(2)} = (\Theta^{(2)})^T \delta^{(3)}. * \underline{g'(z^{(2)})}$$

$$\delta^{(3)} = (\Theta^{(3)})^T \delta^{(4)} \cdot * g'(z^{(3)})$$

$$\delta^{(2)} = (\Theta^{(2)})^T \delta^{(3)} \cdot * g'(z^{(2)})$$

$$\delta^{(3)} = (\Theta^{(2)})^T \delta^{(3)} \cdot * g'(z^{(2)})$$

$$\delta^{(2)} = (\Theta^{(2)})^T \delta^{(3)} \cdot * g'(z^{(2)})$$

$$\delta^{(3)} = (\Theta^{(3)})^T \delta^{(4)} \cdot * g'(z^{(3)})$$

$$\delta^{(2)} = (\Theta^{(2)})^T \delta^{(3)} \cdot * g'(z^{(2)})$$

$$\delta^{(2)} = (\Theta^{(2)})^T \delta^{(3)} \cdot * g'(z^{(2)})$$

$$\delta^{(3)} = (\Theta^{(3)})^T \delta^{(4)} \cdot * g'(z^{(2)})$$

$$\delta^{(2)} = (\Theta^{(2)})^T \delta^{(3)} \cdot * g'(z^{(2)})$$

$$\delta^{(3)} = (\Theta^{(3)})^T \delta^{(3)} \cdot * g'(z^{(3)})$$

Layer 1

Layer 2

Layer 3

Laver 4

Backpropagation algorithm

→ Training set
$$\{(x^{(1)}, y^{(1)}), \dots, (x^{(m)}, y^{(m)})\}$$

Set
$$\triangle_{ij}^{(l)} = 0$$
 (for all l, i, j). (use to separte $\frac{1}{300}$ $\mathbb{I}(\Theta)$)

For
$$i = 1$$
 to $m \leftarrow (x^{(i)}, y^{(i)})$

Set
$$a^{(1)} = x^{(i)}$$

Perform forward propagation to compute
$$a^{(l)}$$
 for $l=2,3,\ldots,L$

Using
$$\underline{y^{(i)}}$$
, compute $\delta^{(L)} = \underline{a^{(L)}} - \underline{y^{(i)}}$

Using
$$y^{(i)}$$
, compute $\delta^{(L)} = u^{(L)} - y^{(i)}$

$$\begin{array}{c} \text{Compute } \delta^{(L-1)}, \delta^{(L-2)}, \dots, \delta^{(2)} \\ \Rightarrow \triangle_{ij}^{(l)} := \triangle_{ij}^{(l)} + a_j^{(l)} \delta_i^{(l+1)} \end{array}$$

$$\Delta_{ij}^{(l)} := \Delta_{ij}^{(l)} + a_j^{(l)} \delta_i^{(l+1)}$$

$$D_{ij}^{(l)} := \frac{1}{m} \triangle_{ij}^{(l)} + \lambda \Theta_{ij}^{(l)} \text{ if } j \neq 0$$

$$D_{ij}^{(l)} := \frac{1}{m} \triangle_{ij}^{(l)} \text{ if } j = 0$$

$$\frac{\partial}{\partial \Theta_{ij}^{(l)}} J(\Theta) = D_{ij}^{(l)}$$

Machine Learning

Neural Networks: Learning

Backpropagation intuition

Forward Propagation

Forward Propagation

What is backpropagation doing?

$$J(\Theta) = -\frac{1}{m} \left[\sum_{i=1}^{m} y^{(i)} \log(h_{\Theta}(x^{(i)})) + (1 - y^{(i)}) \log(1 - (h_{\Theta}(x^{(i)}))) \right] + \frac{\lambda}{2m} \sum_{l=1}^{L-1} \sum_{i=1}^{s_l} \sum_{j=1}^{s_{l+1}} (\Theta_{ji}^{(l)})^2$$

$$(\mathbf{x}^{(i)}, \mathbf{y}^{(i)})$$

Focusing on a single example $x^{(i)}$, $y^{(i)}$, the case of 1 output unit, and ignoring regularization ($\lambda = 0$),

$$cost(i) = y^{(i)} \log h_{\Theta}(x^{(i)}) + (1 - y^{(i)}) \log h_{\Theta}(x^{(i)})$$

(Think of $cost(i) \approx (h_{\Theta}(x^{(i)}) - y^{(i)})^2$)

I.e. how well is the network doing on example i?

Forward Propagation

Andrew Ng

Machine Learning

Neural Networks: Learning

Implementation note: Unrolling parameters

Advanced optimization

```
function [jVal, gradient] = costFunction(theta)
optTheta = fminunc(@costFunction, initialTheta, options)
 Neural Network (L=4):

ightharpoonup \Theta^{(1)}, \Theta^{(2)}, \Theta^{(3)} - matrices (Theta1, Theta2, Theta3)
     \rightarrow D^{(1)}, D^{(2)}, D^{(3)} - matrices (D1, D2, D3)
 "Unroll" into vectors
```

Example

```
s_1 = 10, s_2 = 10, s_3 = 1
                                                                                              \rightarrow h_{\Theta}(x)
 \Theta^{(1)} \in \mathbb{R}^{10 \times 11}, \Theta^{(2)} \in \mathbb{R}^{10 \times 11}, \Theta^{(3)} \in \mathbb{R}^{1 \times 11}
 \rightarrow D^{(1)} \in \mathbb{R}^{10 \times 11}, D^{(2)} \in \mathbb{R}^{10 \times 11}, D^{(3)} \in \mathbb{R}^{1 \times 11}
→ thetaVec = [ Theta1(:); Theta2(:); Theta3(:)];
\rightarrow DVec = [D1(:); D2(:); D3(:)];
    Theta1 = reshape(thetaVec(1:110),10,11);
→ Theta2 = reshape(thetaVec(111:220),10,11);
Theta3 = reshape(thetaVec(221:231),1,11);
```

Learning Algorithm

- \rightarrow Have initial parameters $\Theta^{(1)}, \Theta^{(2)}, \Theta^{(3)}$.
- → Unroll to get initialTheta to pass to
- -> fminunc(@costFunction, initialTheta, options)

```
function [jval, gradientVed] = costFunction (thetaVec) 

\rightarrow From thetaVec, get \Theta^{(1)}, \Theta^{(2)}, \Theta^{(3)} residue.

\rightarrow Use forward prop/back prop to compute D^{(1)}, D^{(2)}, D^{(3)} J(\Theta) and D^{(1)}, D^{(2)}, D^{(3)} Unroll to get gradientVec.
```

Machine Learning

Neural Networks: Learning

Gradient checking

Numerical estimation of gradients
$$\frac{1}{3(e-\epsilon)} = \frac{1}{3(e+\epsilon)} =$$

Parameter vector θ

$$op heta \in \mathbb{R}^n$$
 (E.g. $heta$ is "unrolled" version of $\Theta^{(1)}, \Theta^{(2)}, \Theta^{(3)}$)

$$\rightarrow \theta = [\theta_1, \theta_2, \theta_3, \dots, \theta_n]$$

$$\Rightarrow \frac{\partial}{\partial \theta_1} J(\theta) \approx \frac{J(\theta_1 + \epsilon, \theta_2, \theta_3, \dots, \theta_n) - J(\theta_1 - \epsilon, \theta_2, \theta_3, \dots, \theta_n)}{2\epsilon}$$

$$\Rightarrow \frac{\partial}{\partial \theta_2} J(\theta) \approx \frac{J(\theta_1, \theta_2 + \epsilon, \theta_3, \dots, \theta_n) - J(\theta_1, \theta_2 - \epsilon, \theta_3, \dots, \theta_n)}{2\epsilon}$$

$$\Rightarrow \frac{\partial}{\partial \theta_2} J(\theta) \approx \frac{J(\theta_1, \theta_2 + \epsilon, \theta_3, \dots, \theta_n) - J(\theta_1, \theta_2 - \epsilon, \theta_3, \dots, \theta_n)}{2\epsilon}$$

$$\rightarrow \frac{\partial}{\partial \theta_n} J(\theta) \approx \frac{J(\theta_1, \theta_2, \theta_3, \dots, \theta_n + \epsilon) - J(\theta_1, \theta_2, \theta_3, \dots, \theta_n - \epsilon)}{2\epsilon}$$

```
for i = 1:n,
  thetaPlus = theta;
  thetaPlus(i) = thetaPlus(i) + EPSILON;
  thetaMinus = theta;
  thetaMinus(i) = thetaMinus(i) - EPSILON;
  gradApprox(i) = (J(thetaPlus) - J(thetaMinus))
                 = (0 (Checallon); \frac{2}{30}; \sqrt{(2*EPSILON)};
end;
Check that gradApprox ≈ DVec ←
```

Implementation Note:

- ightharpoonup Implement backprop to compute m DVec (unrolled $D^{(1)}_-, D^{(2)}, D^{(3)}$)
- ->- Implement numerical gradient check to compute gradApprox.
- ->- Make sure they give similar values.
- Turn off gradient checking. Using backprop code for learning.

Important:

- Be sure to disable your gradient checking code before training your classifier. If you run numerical gradient computation on every iteration of gradient descent (or in the inner loop of costFunction (...))your code will be very slow.

Machine Learning

Neural Networks: Learning

Random initialization

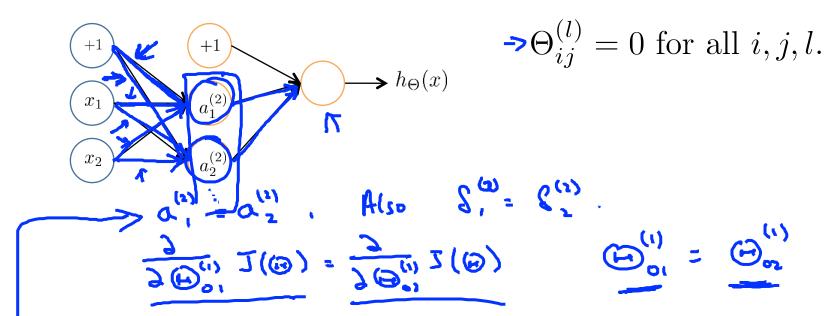

Initial value of Θ

For gradient descent and advanced optimization method, need initial value for $\boldsymbol{\Theta}$.

Consider gradient descent

Set initialTheta = zeros(n,1)?

Zero initialization

After each update, parameters corresponding to inputs going into each of two hidden units are identical.

Random initialization: Symmetry breaking

Initialize each $\Theta_{ij}^{(l)}$ to a random value in $[-\epsilon, \epsilon]$ (i.e. $-\epsilon \leq \Theta_{ij}^{(l)} \leq \epsilon$)

Tanlom 10×11 matrix (betw. 0 and 1)

Machine Learning

Neural Networks: Learning

Putting it together

Training a neural network

Pick a network architecture (connectivity pattern between neurons)

- \rightarrow No. of input units: Dimension of features $x^{(i)}$
- → No. output units: Number of classes

Reasonable default: 1 hidden layer, or if >1 hidden layer, have same no. of hidden units in every layer (usually the more the better)

Training a neural network

- → 1. Randomly initialize weights
- \rightarrow 2. Implement forward propagation to get $h_{\Theta}(x^{(i)})$ for any $x_{-}^{(i)}$
- \rightarrow 3. Implement code to compute cost function $J(\Theta)$
- \rightarrow 4. Implement backprop to compute partial derivatives $\frac{\partial}{\partial \Theta_{jk}^{(l)}} J(\Theta)$

$$\rightarrow \text{ for } i = 1:m \left\{ \left(\frac{\chi^{(i)}, y^{(i)}}{\chi^{(i)}} \right) \left(\frac{\chi^{(i)}, y^{(i)}}{\chi^{(i)}} \right), \dots, \left(\frac{\chi^{(m)}, y^{(m)}}{\chi^{(m)}} \right)^{(m)} \right\}$$

 \Longrightarrow Perform forward propagation and backpropagation using example $(x^{(i)},y^{(i)})$

(Get activations $\underline{a^{(l)}}$ and delta terms $\underline{\delta^{(l)}}$ for $l=2,\ldots,L$).

Training a neural network

- ⇒ 5. Use gradient checking to compare $\frac{\partial}{\partial \Theta_{jk}^{(l)}} J(\Theta)$ computed using backpropagation vs. using numerical estimate of gradient of $J(\Theta)$.
 - → Then disable gradient checking code.
- \rightarrow 6. Use gradient descent or advanced optimization method with backpropagation to try to minimize $J(\Theta)$ as a function of parameters Θ

Machine Learning
